

**WHAT IS CLAIMED IS:**

- 1 1. A method of establishing concurrent network  
2 connections, said method comprising:  
3 receiving a resource request;  
4 identifying an active credential from a plurality of  
5 stored active credentials;  
6 retrieving the active credential in response to the  
7 identifying; and  
8 accessing the requested resource using the retrieved  
9 active credential.
- 1 2. The method as described in claim 1 further comprising:  
2 defining a new active credential in response to not  
3 identifying the active credential.
- 1 3. The method as described in claim 1 wherein the active  
2 credential includes a dynamic data field.
- 1 4. The method as described in claim 3 further comprising:  
2 accepting authorization data corresponding to a  
3 network connection;  
4 determining whether the authorization data includes  
5 dynamic data; and  
6 storing a dynamic data description based on the  
7 determination.
- 1 5. The method as described in claim 4 further comprising:  
2 prompting a user for dynamic input based on the  
3 dynamic data description;  
4 storing the dynamic input in the dynamic data field  
5 within the active credential;  
6 sending the active credential to a computer network  
7 corresponding to a login session; and

8       accessing the computer network.

1   6.   The method as described in claim 1 wherein the stored  
2       active credential includes one or more definition  
3       fields.

1   7.   The method as described in claim 6 wherein the  
2       definition fields are selected from the group  
3       consisting of a domain name, a server name, a user id,  
4       and a password.

5   8.   An information handling system comprising:  
6       one or more processors;  
7       a memory accessible by the processors;  
8       one or more nonvolatile storage devices accessible by  
9       the processors;  
10      a concurrent network connection tool to execute  
11       network connections, the concurrent network  
12       connection tool including:  
13       means for receiving a resource request;  
14       means for identifying an active credential from a  
15       plurality of stored active credentials;  
16       means for retrieving the active credential in  
17       response to the identifying; and  
18       means for accessing the requested resource using  
19       the retrieved active credential.

1   9.   The information handling system as described in claim  
2       8 further comprising:  
3       means for defining a new active credential in response  
4       to not identifying the active credential.

- 1 10. The information handling system as described in claim  
2 8 wherein the active credential includes a dynamic  
3 data field.
- 1 11. The information handling system as described in claim  
2 10 further comprising:  
3 means for accepting authorization data corresponding  
4 to a network connection;  
5 means for determining whether the authorization data  
6 includes dynamic data; and  
7 means for storing a dynamic data description based on  
8 the determination.
- 1 12. The information handling system as described in claim  
2 11 further comprising:  
3 means for prompting a user for dynamic input based on  
4 the dynamic data description;  
5 means for storing the dynamic input in the dynamic  
6 data field corresponding to the active  
7 credential;  
8 means for sending the active credential to a computer  
9 network corresponding to a login session; and  
10 means for accessing the computer network.
- 1 13. The information handling system as described in claim  
2 8 wherein the stored active credential includes one or  
3 more definition fields and wherein the definition  
4 fields are selected from the group consisting of a  
5 domain name, a server name, a user id, and a password.
- 1 14. A computer program product stored in a computer  
2 operable media for executing concurrent network  
3 connections, said computer program product comprising:

4 means for receiving a resource request;  
5 means for identifying an active credential from a  
6 plurality of stored active credentials;  
7 means for retrieving the active credential in  
8 response to the identifying; and  
9 means for accessing the requested resource using  
10 the retrieved active credential.

1 15. The computer program product as described in claim 14  
2 further comprising:  
3 means for defining a new active credential in response  
4 to not identifying the active credential.

1 16. The computer program product as described in claim 14  
2 wherein the active credential includes a dynamic data  
3 field.

1 17. The computer program product as described in claim 16  
2 further comprising:  
3 means for accepting authorization data corresponding  
4 to a network connection;  
5 means for determining whether the authorization data  
6 includes dynamic data; and  
7 means for storing a dynamic data description based on  
8 the determination.

1 18. The computer program product as described in claim 17  
2 further comprising:  
3 means for prompting a user for dynamic input based on  
4 the dynamic data description;  
5 means for storing the dynamic input in the dynamic  
6 data field corresponding to the active  
7 credential;

8 means for sending the active credential to a computer  
9 network corresponding to a login session; and  
10 means for accessing the computer network.

1 19. The computer program product as described in claim 14  
2 wherein the stored active credential includes one or  
3 more definition fields.

1 20. The computer program product as described in claim 19  
2 wherein the definition fields are selected from the  
3 group consisting of a domain name, a server name, a  
4 user id, and a password.
